Godzilla Premium/LE Turntable Ball Trap Eliminator

Tired of stuck balls? Even Mecha himself gets frustrated about it. Too many times during a great game a slow roller or soft plunge will get caught on the Mecha-Godzilla turntable forcing you to tilt out and lose that valuable Stern Insider Connected progress *and* your epic score.

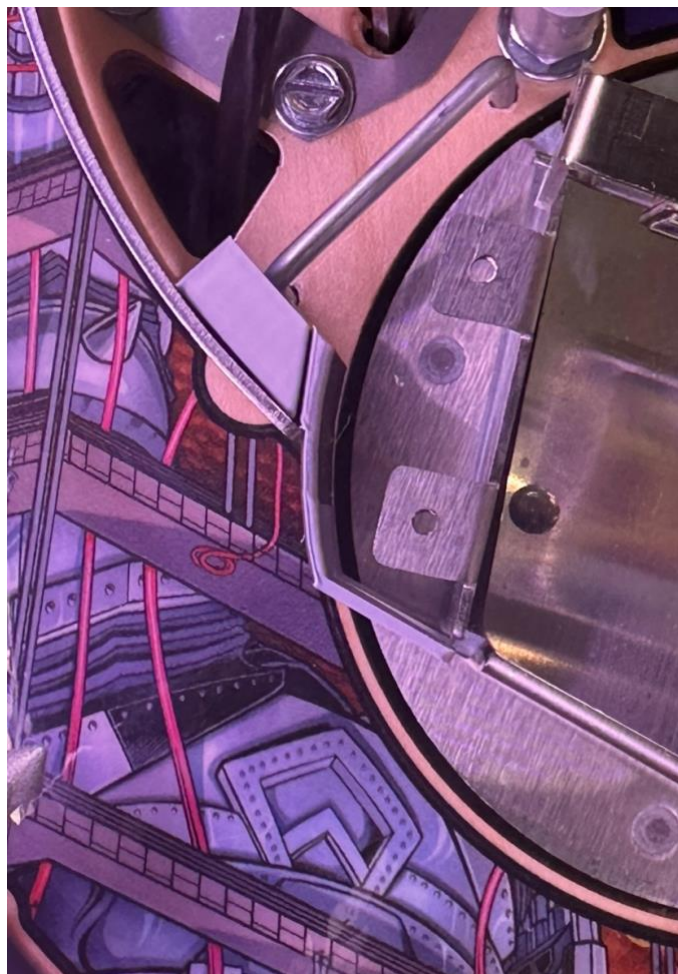

The Godzilla turntable Ball Trap Eliminator is here to solve the issue

To install, simply remove the right-side turntable plastic along with the scoop plastic

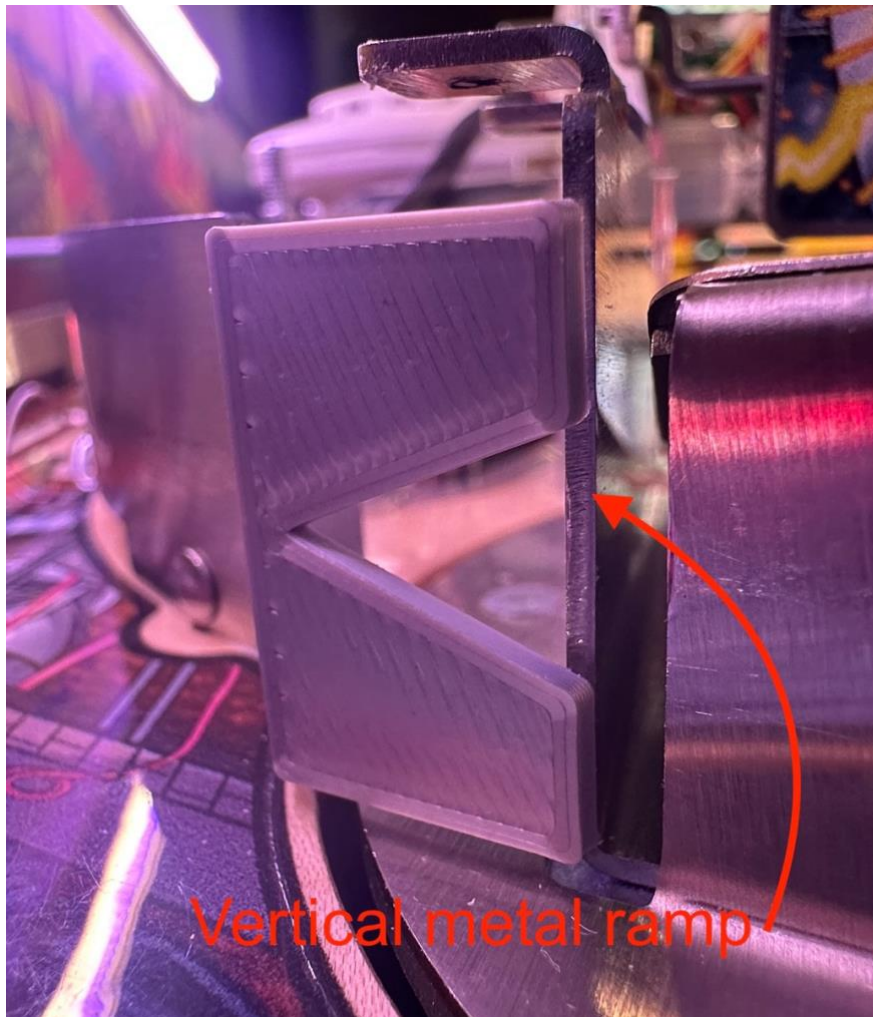

Once removed insert the ball trap eliminator between the ball guide wire and horizontal flat guide and press down to secure.

Next, adjust the two sliding component to ensure that the back of the V-shaped component just touches the end of the vertical metal ramp so that there is no gap between the BTE and the turntable in “ramp” position. In “Target position” the side of the ramp will come into contact with the back of the BTE and deflect slightly. This is normal operation.

*NOTE - For most games the two pieces will sit flush with the both components all the way up against the metal ball guide. If your turntable sits lower you can adjust the two component pieces in opposite directions to lower the arm and adjust the gap as needed.

This two-piece unit is a friction fit and should stay aligned long-term without adjustment though you can optionally add a drop of CA glue (Superglue) onto the ends to lock the pieces in once satisfied.

The fix is not visible from the players perspective and will guide your ball back to the flipper where it belongs

Replace the plastics and you're done and back to gameplay

Enjoy your new mod and THANK YOU! - www.PerformancePinball.com
